

NATURE'S ENHANCE

FEATURES AND BENEFITS

Nature's Enhance is a liquid fulvic acid based, natural electrolyte that will balance and energize soil systems, and is capable of conducting electrical current to restore physical well being, enabling soils to become active and healthy. **Nature's Enhance** has the ability to accomplish this objective in the following ways:

◆ DISSOLVES MINERALS & TRACE ELEMENTS:

Nature's Enhance is especially active in dissolving minerals and metals. The metallic minerals simply dissolve into ionic form, and disappear into the fulvic structure becoming bio-chemically reactive and mobile. **Nature's Enhance** is nature's way of "chelating" metallic minerals, turning them into a readily absorbable bio-available form.

◆ ENHANCES NUTRIENTS:

Nature's Enhance enhances the availability of nutrients and makes them more readily absorbable, allowing minerals to react with cells and to interact with one another, breaking them down into the simplest ionic form chelated by the fulvic acid electrolytes.

◆ TRANSPORTS NUTRIENTS:

Nature's Enhance complexes with minerals and metals making them available to plant roots and more easily absorbable through cell walls, especially minerals such as iron that are not usually very mobile. Fulvic acids dissolve and transpose vitamins, coenzymes, auxins-hormones and natural antibiotics that are generally found throughout the soil making them available. These substances are effective in stimulating vigorous and healthy growth promoting certain bacteria, fungi and actinomycetes in the soil. It has been determined that all known vitamins can be present in healthy soils. Plants manufacture many of their own vitamins, yet those in soil are able to supplement the plant further. Upon ingestion, animals and humans easily absorb these nutrients, as they appear in perfect plant form as nature intended.

◆ INCREASES ASSIMILATION:

Nature's Enhance is of a low molecular weight, low molecular size, and is capable of a high degree of penetration into cells. The **Nature's Enhance** fulvic acid complexes are able to readily pass through semi-permeable membranes such as cell walls. It is important to note that **Nature's Enhance** has the ability to transport nutrients through cell membranes.

◆ STIMULATES METABOLISM:

Oxygen is absorbed more intensely in the presence of fulvic acids. **Nature's Enhance** aids in penetrating plant roots, relieving oxygen deficiency, increasing the vital activity of cells, and changing the pattern of the metabolism of carbohydrates, resulting in an accumulation of soluble sugars. These soluble sugars increase the pressure of osmosis inside the cell walls and enable plants to withstand wilting, while enhancing stimulation to the immune system.

◆ DETOXIFIED POLLUTANTS:

An important aspect of **Nature's Enhance** is related to its absorptive interaction with environmental chemicals, either before or after they reach concentrations toxic to living organisms. **Nature's Enhance** rapidly detoxifies the herbicide known as Paraquat. **Nature's Enhance** is also vital in helping form new species of metal ions, binding with organic pollutants such as pesticides and herbicides and catalyzing the breakdown of toxic pollutants.

◆ DISSOLVES SILICA:

Nature's Enhance is especially important because of its ability to complex or chelate metal ions and interact with silica. It has been shown that these interactions may increase the concentrations of metal ions and silica found in water solutions to levels that are far in excess of their assumed dissolution ability.

◆ SYNTHESIS:

Nature's Enhance has the ability to inter-react with cells to synthesize or transmute new mineral compounds. The transmutation of vegetal silica and magnesium to form calcium in animal and human bones is a typical example of synthesis of minerals.

◆ ENHANCES CELL DIVISION AND ELONGATION:

Nature's Enhance stimulates and balances cells creating optimal growth and replication conditions.

◆ INCREASES METABOLISM OF PROTEINS:

Nature's Enhance intensifies the metabolism of proteins. It increases DNA content in cells, and enhances the rate of RNA synthesis.

◆ CHELATES ALL MONOVALENT & DIVALENT ELEMENTS:

Nature's Enhance is an excellent natural chelator and cation exchanger, chelating all elements to which it is exposed.
